

Raw HTML Widget

Version 7

Published 4/20/2017 05:58 PM by [Anonymous User](#) Last updated 6/8/2022 07:21 PM by [JD Flores](#)

The Raw HTML widget is a flexible widget that allows you to add custom code to display any type of content that you desire. This content can be static with just HTML and CSS, or dynamic using JavaScript. You can create your own widgets using HTML, CSS, and JavaScript; embed external feeds and entire pages; pull data from external data sources and display the data in the widget; and much more.

The widget **Properties** tab contains a code editor where you can add any HTML, CSS, and scripts.

The screenshot shows the 'Configure Widget' dialog box with the 'Properties' tab selected. The 'Title' field contains 'Raw HTML'. Below it, the 'Raw HTML' field contains the following code:

```
1 <div class="axero-widget">
2   <div class="axero-widget-header">
3     <h3>Header name</h3>
4   </div>
5   <div class="axero-widget-content axero-widget-content-padded">
6     <p>Your content goes here</p>
7   </div>
8   <div class="axero-widget-footer">
9     <!-- optional -->
10  </div>
11 </div>
```

Below the code editor is an 'Insert resource' field.

To add a system resource, start typing under **Insert resource** then click the resource. Tokens and resources are added where your blinking cursor is.

In the **Roles** tab, you can choose the roles that can view this widget.

Raw HTML Widget Examples

[Launchpad Widget - Large](#)

The Launchpad is a custom widget that you can use to provide hyperlinks to launch into your other systems. The Launchpad is built using a Raw HTML widget.

[Show Password Checkbox](#)

The **Show password** checkbox toggles password visibility on the login page. The checkbox uses HTML and JavaScript.

Social Media Feeds

The Raw HTML widget is also great for displaying Twitter, Facebook, and other social media feeds. These services provide you with an embed code. Copy and paste the embed code into a Raw HTML widget.

[Facebook Feed](#)

[Instagram Post](#)

[Twitter Feed](#)

Axero Widget Style

You can wrap your Raw HTML content in the Communifire basic widget to match the style of other widgets. Use the code below.

```
<div class="axero-widget">
  <div class="axero-widget-header">
    <h3>Header name</h3>
  </div>
  <div class="axero-widget-content axero-widget-content-padded">
    <p>Your content goes here</p>
  </div>
  <div class="axero-widget-footer">
    <!-- optional -->
  </div>
</div>
```

Result:

Header name

Your content goes here

Mobile Raw HTML Widget

Raw HTML Widget on Mobile is available.

1. To add Raw HTML on mobile pages go to your [Page Builder](#) page, select **Mobile Layout**, drag **Raw HTML** widget to in the section, then **Edit Properties**.

2. Enter the HTML content in the widget. Click **Save**.

3. The widget is now displayed in the mobile layout.

[Content Security Policy \(CSP\)](#)

Content Security Policy (CSP) is a security setting that sets the external sites your site can load resources from. If a resource comes from a site that isn't in the CSP whitelist, that resource is blocked. You can request to set CSP for your intranet.
