File Directory Properties

The file directory object is used to store files in the Communifire system. It includes the Directory ID that is used to make reference to the particular file directory throughout the system. Each Directory ID is unique and automatically generated by Communifire.

Attributes	Notes	Data type
DirectoryID	This is the ID value which uniquely identifies each directory in the Communifire. Generated automatically. This cannot be changed.	int
DirectoryName	Name of directory.	string
MediaServerID	ID of the media server on which the file directory is created.	int
MediaServerRootURL	Root URL of the media server.	string
ParentID	Unique ID of parent directory under which directory is created.	int
RootDirectroyPath	Path of the root directory.	string
SpaceID	Unique ID of space.	int
SpaceName	Name of space.	string
UserID	ID of the user who created the directory.	int

`Please Note` Refer to REST API: Create File Directory for how to create a file directory via the REST API.
