User Visibility Options

Take Control of your privacy settings and visibility options in Axero. There are 3 visibility settings for user profile fields:

1. Private (only visible to the user)

2. Community (only visible to logged in users)

3. Public (visible to all users + guests)

These settings are set by the Axero team via CSV upload to the database. Clients provide a CSV of users (rows), fields (columns), and the desired visibility setting for each (private, community, public).

After the initial upload via CSV, it can only be updated via API. There are two APIs, one for multiple and one for single.

Further details on these APIs can be read in the corresponding documentation:
