I was excited to find this brave little challenge in the sea of productivity and negativity complaints. Here's a person, I thought, who is not out to brainwash and slave-drive her fellow coworkers. But to refresh and entertain! This is an update.

I was excited because she and I have the same passion. I am not looking to bore people to death with stale ideas either. I am here to make sure you have a good time. If possible, in more ways than one. But if you asked me what my biggest challenge was in writing these posts, I wouldn't say "fresh ideas." I'd say: the time to record all the amazing stuff I come across every day.

Average Rating Calculation

CommuniFire computes ratings for content using a Bayesian model, inspired by IMDb's "true Bayesian estimate". The model predicts the average rating for content with few ratings by using other data available to better reflect the true average. Ratings are calculated using the following formula:

$$(WR) = (v \div (v + m)) \times R + (m \div (v + m)) \times C$$

Variables:

- WR: weighted rating
- R: average for the resource
- v: number of votes for the resource
- m: average of the number of votes
- C: the average rating based on all resources
